

# Draft information

version: draft-4.0

*2019-04-26*

## Requests to coauthors

- Specify grant numbers in the Acknowledgements and make sure the ones stated there now are correct.
- Suggestions to bring the abstract down to 150 words.
- Approve (or not) for submission.

## Changes since the last draft

- Removed the criterion to distinguish between competition and facilitation that was based on the difference between conspecific pollen in open and bagged flowers as it didn't add much to the story (said the same as the previously published criterion based on the relationship between conspecific and heterospecific pollen) and was based on some assumptions that are easy to question.
- This simplified Figure 1
- Added .git and .drake to .dockerignore to speed up build
- I refer to the variables on the main model's factors and use that term consistently throughout the paper. Previously I was using factor, variable, and sometimes mechanism interchangeably
- Many minor changes to the text
- Replaced instances of "plant abundance" to the more specific term "floral abundance" (Jamie suggested some people working in the field might be finicky with terminology).
- Some extra refs added
- Moved the sentences about variable collinearity to the supp. info. to save a bit of space in the main text
